

YAML Use-Cases

Scenario 2: Nested Data Structures

Create a YAML configuration file that captures detailed information about individuals in a database. Specifically, you are tasked with creating a structure for representing a person's information. The YAML structure should include the following:

- **Person's Name:** Provide a name for the **person**.
- **Age:** Specify the **age** of the person.
- For each person, you should also include an "**Address**" section with the following attributes:
 - **Street:** The **street address** where the person lives.
 - **City:** person residing in **Bangalore**.
 - **ZIP Code:** maybe **560001**.

Create a well-structured YAML configuration that captures this information for multiple individuals. This structure should be nested, with each person's information enclosed within their respective "person" block, including their name, age, and address details.
