YAML Use-Cases

Scenario 7: Nested Lists and Advanced Data Structures

You are building a **system to manage various categories and items**, and you need to create a YAML configuration file to store this information. Your configuration should include the following details:

Categories:

Define a list of categories, where each category should have the following attributes:

- **Name:** Specify the name of the category (e.g., **Fruits** or **vegetables**).
- **Items:** List the items within the category. Each item should include the following attributes:
  - **Name:** Specify the name of the item.
  - **Price:** Indicate the price of the item.

Your task is to create a YAML structure that accurately represents these categories and items. Ensure that you have a well-organized hierarchy with categories containing lists of items, and that each item has its name and price attributes.
